

The Perfect Sound Source for Reverberation Time Measurements

Depending on the type and purpose of the room you are measuring, various sound sources may be suitable for Reverberation Time measurements. While the omnidirectional DS3 Dodecahedron Speaker is often the best solution, sometimes a compromise is more convenient.

For buildings with many floors, it can be difficult to take your Dodec with you. So NTi have developed a solution that fits your pocket and fits in your pocket.

Acoustic Sneezing Powder

After no more than a little consideration, we have come up with a product that has unbelievable characteristics; Acoustic Sneezing Powder.

Our researchers have spared lots of expense and time in developing this product. The effectiveness of the powder was measured above 90 dB both times we tried it. The sound is band-limited, saving you a whole lot of frequencies.

There are pepper and chilli variations available that can reach 110 dB at a push. A convenient small packet of white powder is all you need to carry around.

For larger locations, the Acoustic Sneezing Powder is available in 1 kg bags of the white powder (we suggest you avoid customs officials at airports if possible).

"The perfect sound source generation for your measurement, now available at NTi Audio".
